## Threat Model

---

For each system/component/product/service/...

- identify *what* you're protecting
- identify *from whom* you're protecting it
  - identify *goals* of the attacker
  - identify *motivation* of the attacker
  - identify *capabilities* of the attacker
- identify threats you *cannot* defend against

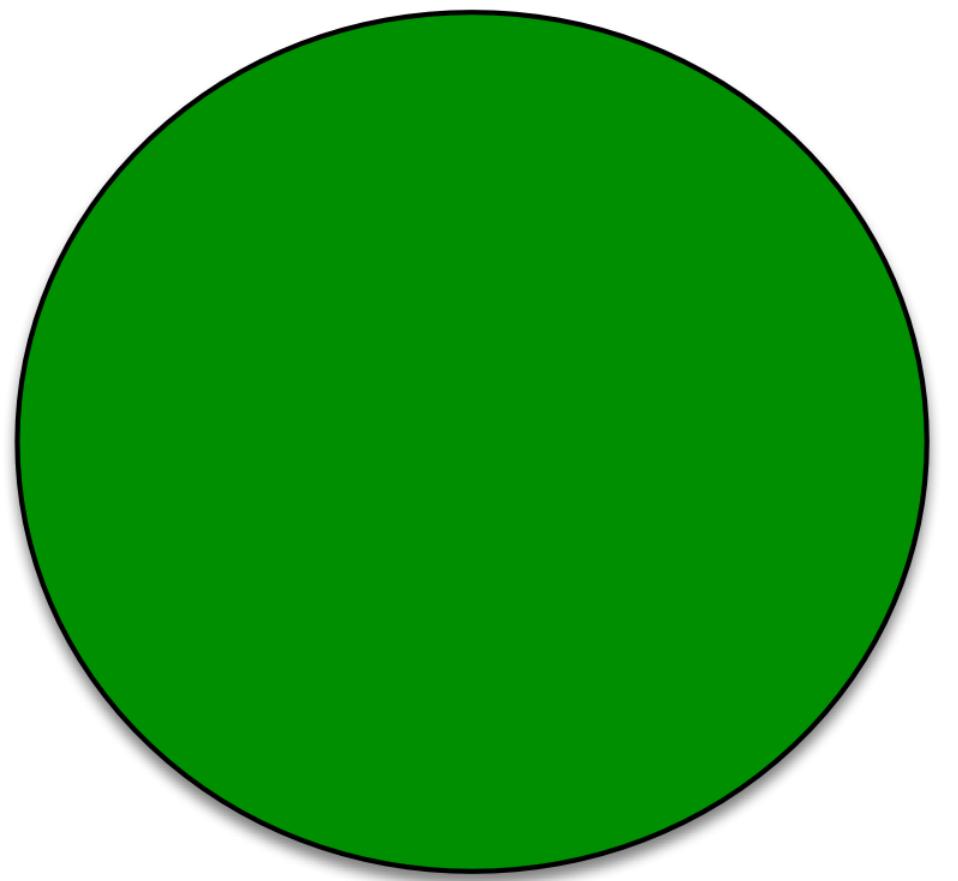

# Threat Model 101

By James Mickens

|                 |  |   |   |
|-----------------|--|---|---|
| <b>Threat</b>   | Ex-girlfriend/boyfriend breaking into your email account and publicly releasing your correspondence with the My Little Pony fan club | Organized criminals breaking into your email account and sending spam using your identity                           | The Mossad doing Mossad things with your email account  |
| <b>Solution</b> | Strong passwords   | Strong passwords + common sense (don't click on unsolicited herbal Viagra ads that result in keyloggers and sorrow) | <ul style="list-style-type: none"><li>◆ Magical amulets?</li><li>◆ Fake your own death, move into a submarine?</li><li>◆ YOU'RE STILL GONNA BE MOSSAD'ED UPON</li></ul> |

# STRIDE

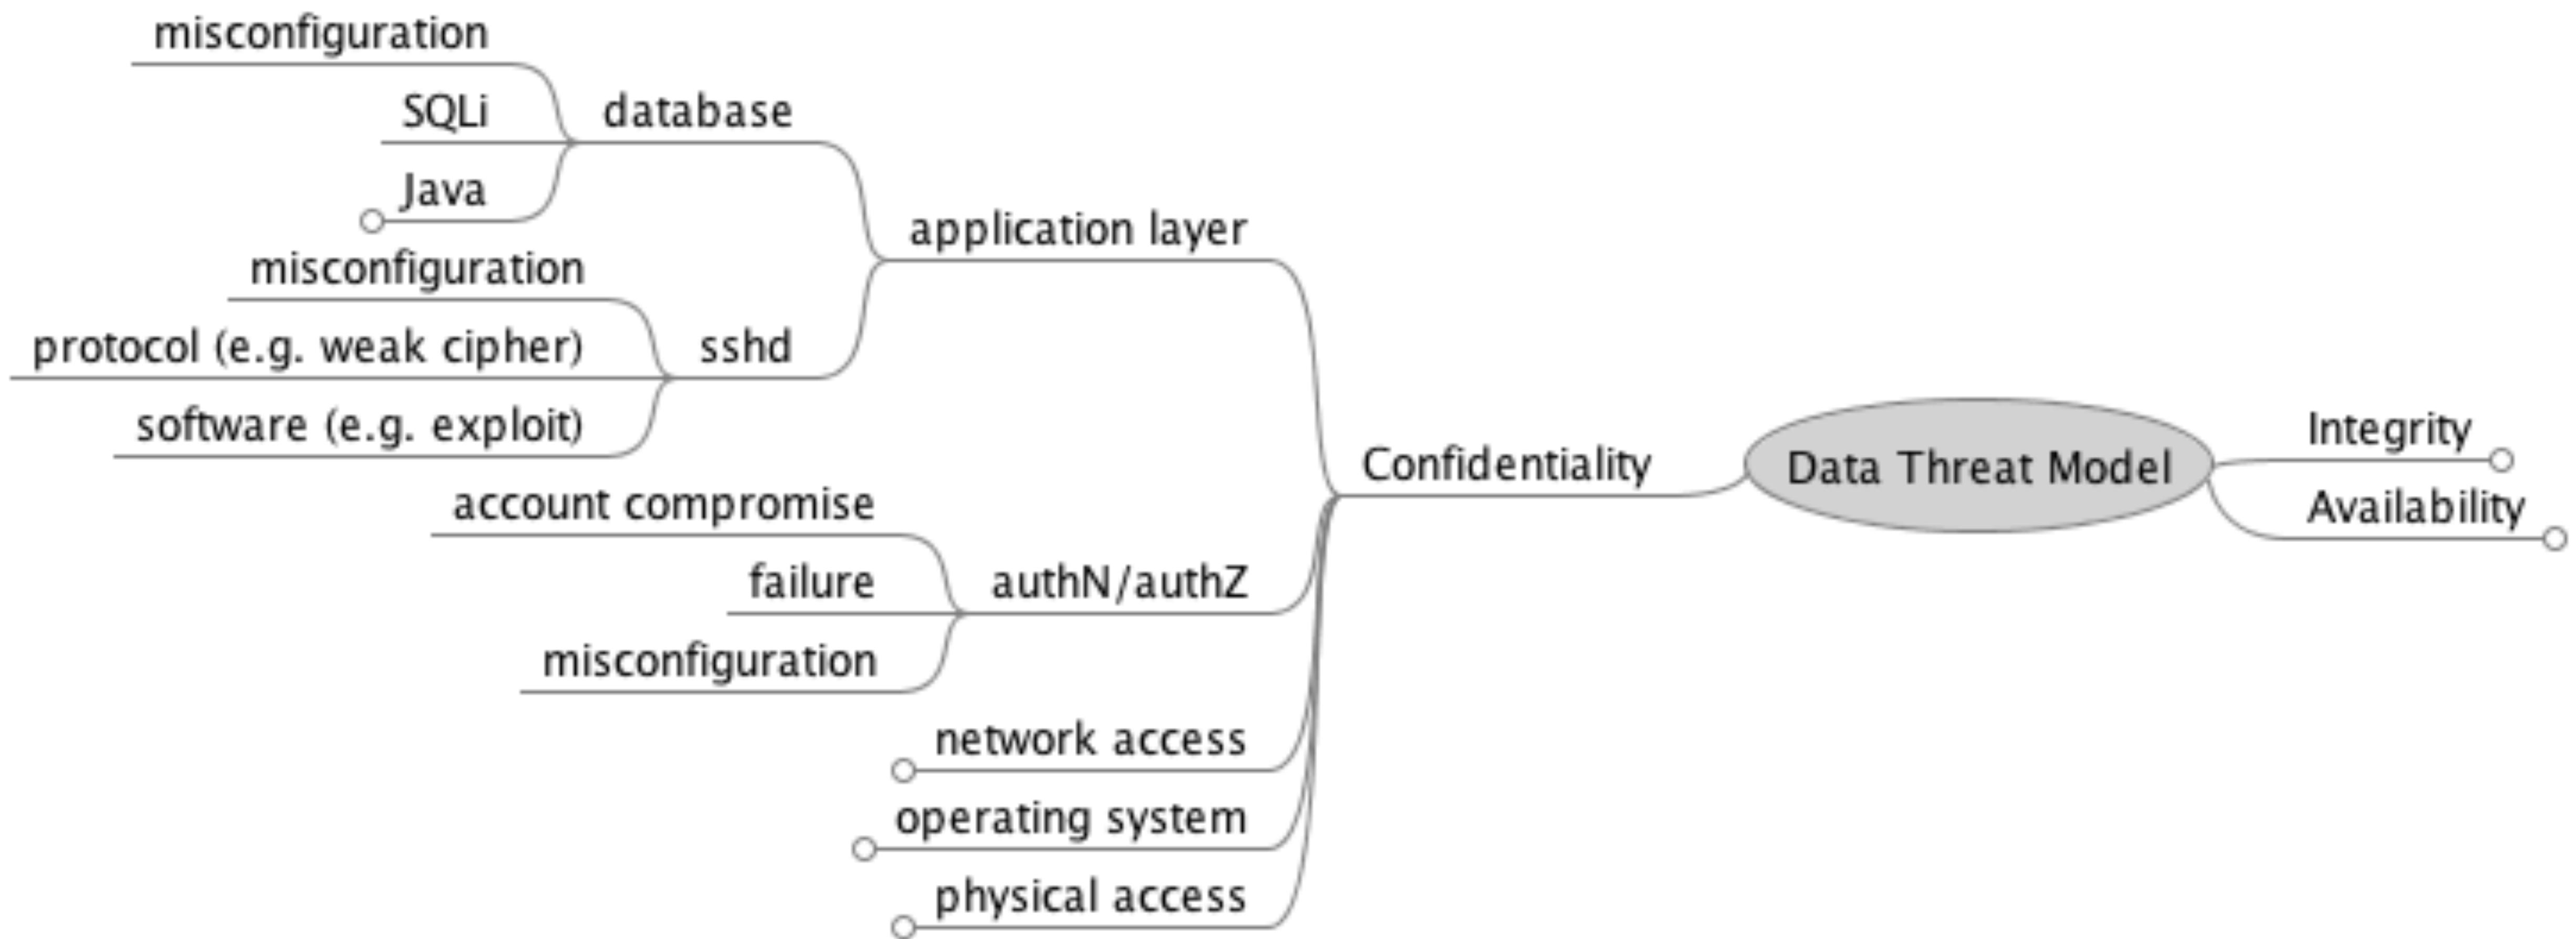

*Threat*

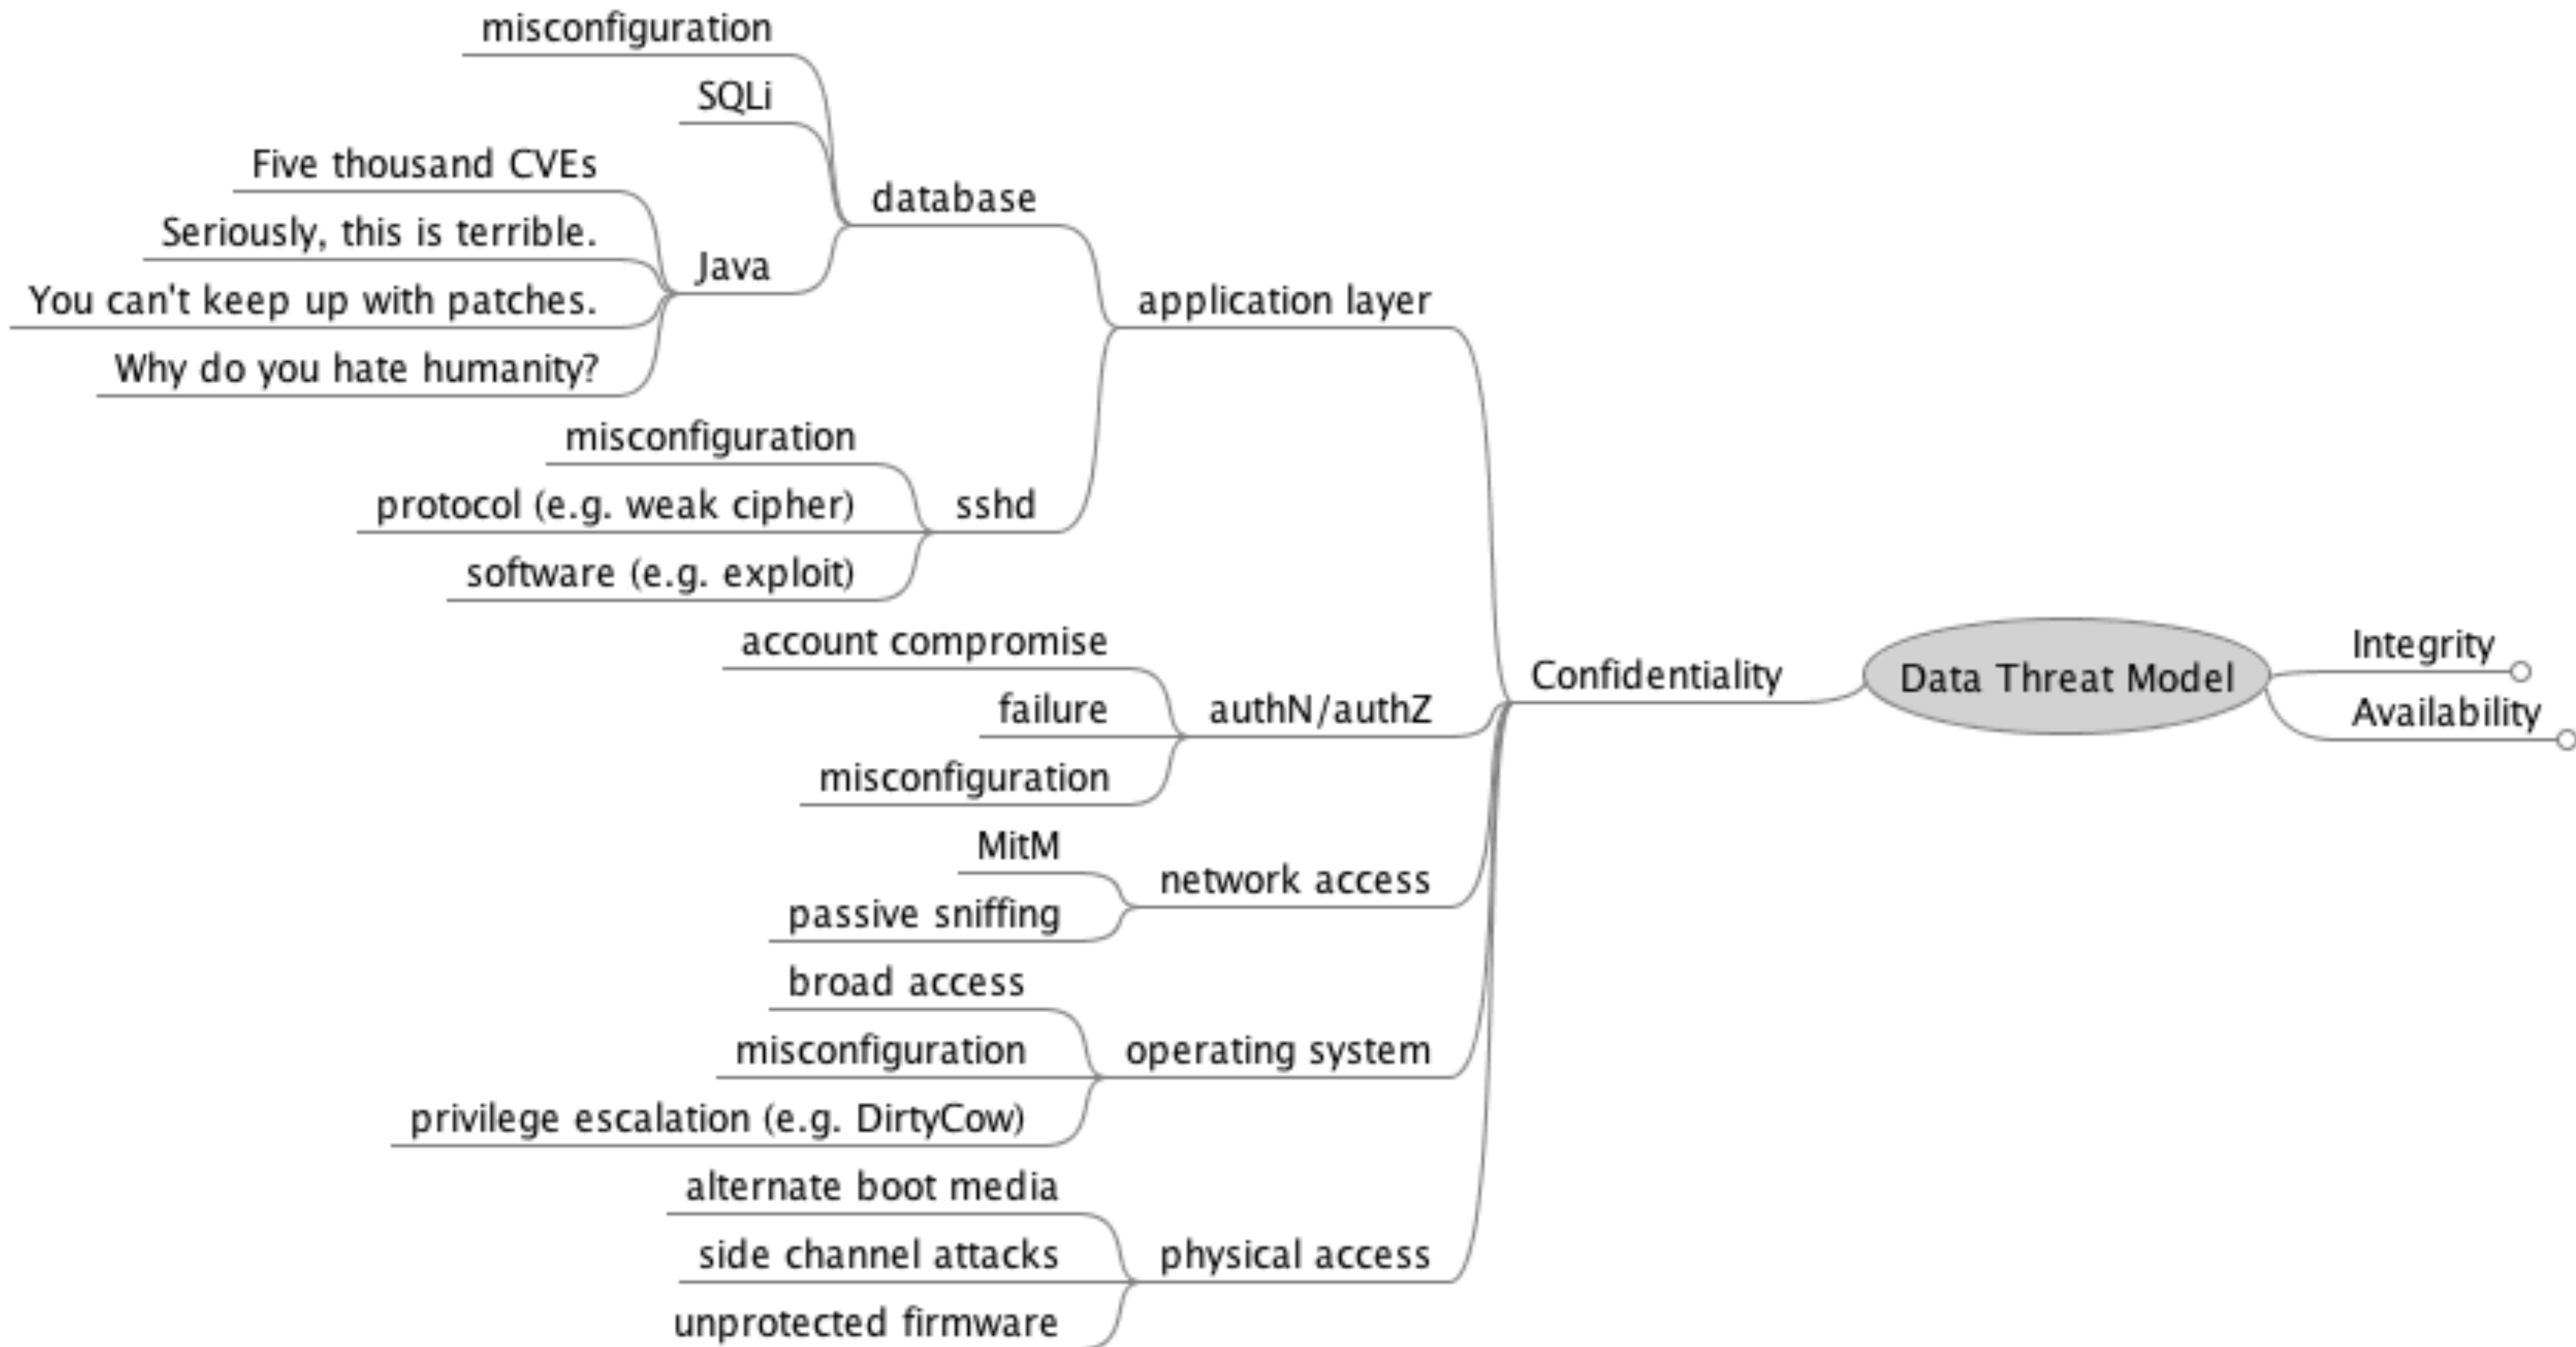

*Property*

|                        |                 |
|------------------------|-----------------|
| Spoofing               | Authentication  |
| Tampering              | Integrity       |
| Repudiation            | Non-Repudiation |
| Information Disclosure | Confidentiality |
| Denial of Service      | Availability    |
| Elevation of Privilege | Authorization   |

# DREAD

|                        |                                    |
|------------------------|------------------------------------|
| <b>Damage</b>          | How bad would the attack be?       |
| <b>Reproducability</b> | How easy to recreate the attack?   |
| <b>Exploitability</b>  | How easy to launch the attack?     |
| <b>Affected Users</b>  | How many are impacted?             |
| <b>Discoverability</b> | How easy to discover for attacker? |

# DREAD+D

|                        |                                    |
|------------------------|------------------------------------|
| <b>Damage</b>          | How bad would the attack be?       |
| <b>Reproducability</b> | How easy to recreate the attack?   |
| <b>Exploitability</b>  | How easy to launch the attack?     |
| <b>Affected Users</b>  | How many are impacted?             |
| <b>Discoverability</b> | How easy to discover for attacker? |
| <b>Detection</b>       | How hard to detect for defender?   |

Threat Modeling 101 - Example

|    | A                           | B                      | C   | D  | E          | F | G | H |
|----|-----------------------------|------------------------|---|--|------------|---|---|---|
| 1  | Category                    | Name                   | Description   | Access Level / Trust Boundary  | Importance |   |   |   |
| 2  | Confidentiality / Integrity | Database               | Read/Write access to the database containing the primary asset.                 | User-level access to the system with privileges of the database server.<br>Remote access as an authorized user with read/write access. | 10         |   |   |   |
| 3  |                             | Network Access         | Network level (Layer 3 or below) access to the systems comprising the database. | Access to network equipment / upstream connection.   | 5          |   |   |   |
| 4  |                             | OS Access (user level) | Access of an authorized (non-root) account on the systems.                      | sshd (credentialed) or physical  | 8          |   |   |   |
| 5  |                             | OS Access (root)       | Access of the root account.   | Superuser privileges, local user access.   | 9          |   |   |   |
| 6  |                             | Physical Access        | Access to the physical hardware.  | Physical access, local data center privileges.   | 8          |   |   |   |
| 7  |                             |                        |   |  |            |   |   |   |
| 8  |                             |                        |   |  |            |   |   |   |
| 9  |                             |                        |   |  |            |   |   |   |
| 10 |                             |                        |   |  |            |   |   |   |
| 11 |                             |                        |   |  |            |   |   |   |
| 12 |                             |                        |   |  |            |   |   |   |
| 13 |                             |                        |   |  |            |   |   |   |
| 14 |                             |                        |   |  |            |   |   |   |
| 15 |                             |                        |   |  |            |   |   |   |
| 16 |                             |                        |   |  |            |   |   |   |
| 17 |                             |                        |   |  |            |   |   |   |
| 18 |                             |                        |   |  |            |   |   |   |
| 19 |                             |                        |   |  |            |   |   |   |
| 20 |                             |                        |   |  |            |   |   |   |
| 21 |                             |                        |   |  |            |   |   |   |
| 22 |                             |                        |   |  |            |   |   |   |
| 23 |                             |                        |   |  |            |   |   |   |

Threat Matrix (DREAD) - Data

Definition of Assets (Data)

Threat Actor Definitions

Threat Actor Attributes

A CRYPTO NERD'S  
IMAGINATION:

HIS LAPTOP'S ENCRYPTED.  
LET'S BUILD A MILLION-DOLLAR  
CLUSTER TO CRACK IT.

NO GOOD! IT'S  
4096-BIT RSA!

BLAST! OUR  
EVIL PLAN  
IS FOILED!

WHAT WOULD  
ACTUALLY HAPPEN:

HIS LAPTOP'S ENCRYPTED.  
DRUG HIM AND HIT HIM WITH  
THIS \$5 WRENCH UNTIL  
HE TELLS US THE PASSWORD.

GOT IT.

A CRYPTO NERD'S

# Wile E. Coyote has an MBA.

# Threat Modeling Process

- identify assets, assign values
- use STRIDE to identify threats
- use DREAD+D to derive threat score
- determine / recommend defenses
- zoom out / zoom in & repeat

You can't defend against all threats all of the time.

Attackers will go for the lowest hanging fruit.

Raising the cost of attack – not eliminating the entire threat – is frequently sufficient.
